

## **Title: Simulations Using the Random Number Table**

### **Brief Overview:**

The unit will introduce the Random Number Table for performing simulations in Probability. Each simulation will follow the five (5) steps of: stating the problem, stating the assumptions, assigning the digits, simulating the experiment, and stating the conclusions. Emphasis is placed on using the procedure, using the Random Number Table to simulate the experiment, and presenting the results.

### **Links to NCTM 2000 Standards:**

- **Mathematics as Problem Solving, Reasoning and Proof, Communication, Connections, and Representation**

These five process standards are threads that integrate throughout the unit, although they may not be specifically addressed in the unit. They emphasize the need to help students develop the processes that are the major means for doing mathematics, thinking about mathematics, understanding mathematics, and communicating mathematics.

Students will apply the steps to develop the simulations using the Random Number Table to understand both the procedure and the table and to adapt the strategy learned to new situations. They will use inductive reasoning to observe the data, analyze the results, and make comparisons and generalizations from their observations. Students also will use written and oral skills to share the results of their simulations and their analyses. They will be able to compare and connect their simulated results with the theoretical results obtained by tree diagrams and/or a formula. Last of all, students will create and use representations to organize, record, and communicate mathematical ideas. They will use representations to model and interpret physical, social, and mathematical phenomena.

- **Data Analysis, Statistics, and Probability**

Students will collect, organize, and interpret data using the methods of exploratory data analysis; and will understand and apply the basic notions of probability and average.

### **Links to Virginia High School Mathematics Core Learning Units:**

- **Algebra I (A.18)**

Students will compare multiple one-variable data sets using statistical techniques.

- **Algebra II (AII.19)**

Students will collect and analyze data to make predictions and solve problems.

### **Grade/Level:**

Grades 9-12; Algebra I, Algebra II, Statistics, Discrete Mathematics, AP Statistics

**Duration/Length:**

The complete learning unit will take approximately three to five 50 minute classes that will include two days for the actual simulations.

**Prerequisite Knowledge:**

Students should have a working knowledge of the following skills:

- Basic formula for Probability of an event
- Fairness or unbiased concept
- Tree diagrams
- Randomness

**Objectives:**

Students will be able to:

- perform a simulation in the five-step procedure.
- demonstrate the appropriate use of the Random Number Table in order to complete the simulations.
- analyze the data and interpret the results.
- communicate their results both in writing and orally.

**Materials/Resources/Printed Materials:**

- Simulation Worksheets
- Four coins
- Graphing calculator

**Development/Procedures:**

The class will be divided into groups of two or three. With four coins and the Simulation #1 worksheet, each group will follow the steps on the worksheet carefully to understand the procedure and how to read the Random Number Table. The teacher will rotate about the room and facilitate as necessary. All questions on the procedure and the table need to be addressed before proceeding to the next simulations. The groups will write the results and generalizations on the worksheet and present the findings to the rest of the class. After successfully completing Simulation #1, the groups will proceed to Simulations #2 and #3.

**Assessment:**

Group evaluation will be based on the data derived from the Random Number Table, correct analysis and interruption of data results, and accuracy of the tree diagrams.

**Extension/Follow Up:**

- The groups could create additional simulations to practice both the procedure and the use of the Random Number Table.
- Different Random Number Tables can be used from any textbook using probability such as The Practice of Statistics by Daniel Yates, David Moore, and George McCabe.
- Random integers can also be generated from any graphing calculator with a Random function feature such as the TI-83. Instructions for the random number feature for the TI-83 can be found in the manual, Exploration Statistics Handbook for the TI-83 by Larry Morgan and TI-83 Graphing Calculator Guidebook by Texas Instruments.
- Random tables also can be generated from statistical computer software, Minitab.

**Author:**

Fairfax County, VA

## SIMULATION #1

### *Using Random Number Table*

Name: \_\_\_\_\_

Date: \_\_\_\_\_ Period: \_\_\_\_\_

Each group will perform the following steps for the simulation.

1. State problem or describe experiment
2. State all assumptions
3. Assign digits to represent the outcomes
4. Simulate the repetitions
5. State the conclusions in complete sentences

This simulation has steps 1, 2, and 3 already completed to illustrate the procedure.

**Problem:** What is the probability for finding **2 heads and 2 tails** if you toss four coins? Do 25 trials to estimate the probability.

**Assumptions:** The probability of heads or tails is equally likely to occur on each toss. The tosses are independent of each other.

**Assign digits:** In a Random Number Table with digits 0,1,2,3,4,5,6,7,8,9, assign the heads to all even numbers and the tails to all odd numbers. Zero is considered even.

**Simulation:** Look at the Random Number Table and pick a beginning point. Read the numbers horizontally across the row in the table. Follow the line **consecutively** as you assign heads or tails to each digit. An example is shown below that starts at the upper left hand corner of the given table. The results are recorded in the table below.

8501|3      810|10      05|520  
HTHT|T      HTH|TH      HT|THH

TRIAL	RESULT	2 HEADS AND 2 TAILS?
1	HTHT	YES
2	THTH	YES
3	THHT	YES

## **SIMULATION #1**

### *Using Random Number Table*

For simplicity and accuracy, read the table horizontally and continue each trial with the next consecutive digit in the line. **DO NOT** start over at the beginning of each line or move over to another section.

- a. Continue the simulation started below until 25 trials are complete. Record your results in the table that follows:

TRIAL	RESULT	2 HEADS AND 2 TAILS?
1	HTHT	YES
2	THTH	YES
3	THHT	YES

22		
23		
24		
25		

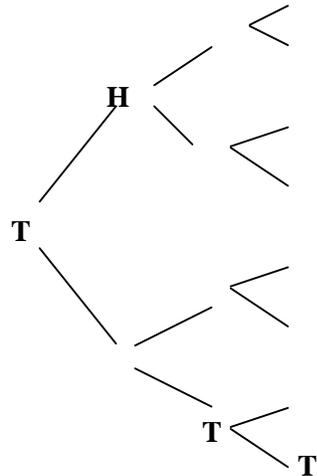

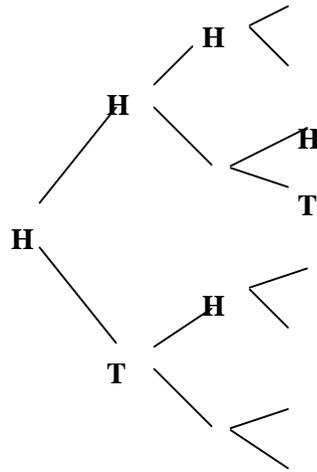

- b. Count the number of successes in obtaining **2 heads and 2 tails**: \_\_\_\_\_

# SIMULATION #1

## *Using Random Number Table*

c. Calculate the probability by using the formula:  $p = \frac{\text{successes}}{\text{trials}} = \underline{\hspace{2cm}}$

d. Complete the tree diagram to find the theoretical probability:

$P = \underline{\hspace{2cm}}$

## **SIMULATION #1**

### *Using Random Number Table*

**Conclusions:** State your conclusions in complete sentences.

# TEACHERS RESOURCES

*Using the Random Number Table*

Answers to Simulation #2 (cont.)

$$P = 10/32 = .3125$$

## TEACHERS RESOURCES

### *Using the Random Number Table*

**Conclusions:** Comments will vary again. Simulation probability is getting closer to the theoretical probability as the trials increase in number.

#### Answers to Simulation #3

**Assumptions:** Each toy is equally likely to occur in each box.  
The toys are independent of each other.  
The company is not "holding back" on any one toy.

**Assign digits:** Each digit represents a different toy.

**Simulation:** a. This partial key will start at **96594** (row 8 column 10).

TRIAL	0	1	2	3	4	5	6	7	8	9	TOTAL
1											21
2											25
3								 			47
4											26

- b. Average will vary according to the starting point in the Random Number Table. Students should be averaging their results to whole numbers because they cannot buy partial boxes.

#### Conclusions:

The students' conclusions will vary. They will see that random numbers can repeat many times as they tally in order to find every toy. **The chart is random.**

Another activity with the numbers generated off the calculator and/or computer will be useful as a follow up. Also, the teacher may wish to place a price value on the box of candy to see on average how much one would expect to pay in order to obtain all the toys.
